

# Secure Virtual Terminal

Enable customers to make payments over the phone without exposing their card data

Collect card payments without compromising customer-data security.

Promote a relationship of trust with your customers.

Avoid financial penalties of PCI DSS non-compliance.

Use from any location on any telephone.

Easy to implement, simple to use — no hardware to install!

Track transaction activity through reporting and real-time alerts.

## How it works

When you make and receive calls via the Paytia platform your business can take payments securely. When you are ready for your customers to give you their payment-card details, you will start a secure payment mode by dialing 7, 2, 9 on your telephone keypad.

Your customer will then be asked to enter their card number, expiry date, and security code using their telephone keypad.

You can see and hear your customer's entry progress as card information is entered in real-time.

The Paytia Secure Virtual Terminal takes approximately 96% responsibility for PCI DSS.

## Sign up in minutes

Paytia can enable secure payments on your phone system in under 30 minutes. Paytia also provides free onboarding support and there are no set up fees.
