Collect card payments without compromising customer-data security

Promote a relationship of trust with your customers

Avoid financial penalties of PCI DSS non-compliance

Use from any location on any telephone

Easy to implement, simple to use — no hardware to install!

Track transaction activity through reporting and real-time alerts

## Why use Keyphone

Protecting your customer's most sensitive payment information has never been more important.

Failing to do so, exposes your business to reputational and financial risk — including fines and higher transaction charges for not complying with Payment-Card Industry DataSecurity Standards (PCI DSS) the customers payment card details are never revealed.

## How it works

Paytia Keyphone enables card payments to be made during customer calls without your customer having to disclose their payment card details to you or your staff.

- When you are ready for your customer to make a payment, you initiate a secure-payment mode using the digits 729 on your telephone keypad.
- Your customer will then be asked to confirm the payment amount and then enter their card details securely using their telephone keypad.
- You can monitor data entry and receive authorization verification while still on the call.
- Your money is paid into your account in the normal way.

## Simplicity. Security. Trust

Using Paytia Keyphone could not be easier — for you and your customers. Transactions are managed entirely on your phone keypads, while you remain in constant contact. With card theft ever increasing, Paytia Keyphone is a simple yet effective way to protect your customers and promote trust.
